René Herbert Reich started transcription

Fabianová Ivana 0:03

What is, so you are working for the startup or you are, you are, yeah, OK.

René Herbert Reich 0:08

Yeah.

So we are.

We are working in a program, in a venture based programme called Carbon 13, which is only investing in, yeah, Carbon 13 there in Cambridge and Berlin. And they are only investing into sustainability startups. So maybe as a sustainability manager, you would.

Fabianová Ivana 0:19

Carbon 13.

I'm gonna Google it, yeah.

Ruiz.

I see, okay, yeah.

Okay.

I see.

And when did you start, like, getting into the topic?

René Herbert Reich 0:42

Yep.

So my background is actually sustainability engineering. So I think I started in the topic 2018 quite a while ago. And but I never

Fabianová Ivana 0:51

Okay.

Okay, yes.

Yes.

René Herbert Reich 1:06
I never was brave enough to do it as a startup before I was a more or less an engineering consultant in the sustainability field in Belgium. Yeah, I worked for...

Fabianová Ivana 1:15
That's why I thought something with Belgium I saw on LinkedIn.

René Herbert Reich 1:18
Yeah, exactly. I just moved to Austria recently. It's fine.

Fabianová Ivana 1:20
Yeah.
Oh, you moved back, okay.

René Herbert Reich 1:23
Yeah, and yeah, now I would like, I would like to scale sustainability a little bit more. And no, my first question to you is, are you somehow as a sustainability manager involved in this product development process in this on product level?

Fabianová Ivana 1:24
Okay, okay.
Yeah, right.
Yeah, it's a good question. So I will tell you a bit how we structured, so it will a bit make sense. So we have our heads of, we are part of strategy department. That's also important. So we are part of strategy department. And we have persons in different Functions.

René Herbert Reich 2:01
Mhm.

Fabianová Ivana 2:01
that are our right hands to go to. So we, but it's important to mention that we are in a strategy department. So, and I will then, I can connect you with the person who is a sustainability person sitting in the PLM&E. So that is the product line management

and the engineering. So they are all the engineers and he's our kind of a right hands. to the topics I think you are looking for.
And we are a smaller team, but as I said, we have different person in different functions, but our core team is not that big. So I am responsible for anything that is related to carbon footprints, anything related to climate, and then on the other side, anything that
touches on human rights. And then we have another colleague and he's responsible fully for circular economy.

René Herbert Reich 2:57
Yeah.

FI Fabianová Ivana 2:57
And then there are some others and they're responsible for product conformity. For example, they would maybe also touch on what you're interested in. It's a bit like, you know, it's somewhere we always overlap, somewhere we kind of, our topics obviously are.

René Herbert Reich 3:10
Mm.

FI Fabianová Ivana 3:17
Similar in some ways.
And then there are, there are others responsible for safety, et cetera, people, values, and culture.
And regarding the product development process.
We are looking into that. So we are working hard now with the right hand, with David, that's his name, to the right hand from the PLM and E to set targets, first of all, for carbon. This is a bit of a painful process for us right now.

René Herbert Reich 3:45
Mhm.
Mm-hmm.

FI Fabianová Ivana 3:57

As.
We know how much we would need to reduce our emissions to be 1.5 degree aligned.
But it's very difficult for us because with our products we are dependent on the transition of electric vehicles but electric trucks.
And that is going slower than we are, we anticipated early few years back. And we know like we can't make it until 2030. So we could, without the transition of electric vehicles, the electric truck vehicles, we can't really make it. So our
Our products would be ready, they can be mounted on the tracks that are electric.
And obviously that would reduce our scope 3 emissions, which are 99% of all of our emissions.

René Herbert Reich 4:45
Yeah.
Mhm.

Fabianová Ivana 4:55
There are some other things we could do or we can do or we are doing some other technologies like a load sensing technology. I'm not sure you are familiar.
with that. So it's basically like when our crane is a flagship product or other, we have several product lines, but this is the flagship one. When it's lifting some material, it's taking the diesel right from the diesel engine of the truck and it's running usually constantly.

René Herbert Reich 5:20
Mhm.

Fabianová Ivana 5:26
So it's taking the same amount of diesel, no matter if it's lifting something or if it's just laying there or how heavy is the load. And the load sensing technology is like you can hear the engine is going really quietly if it's just standing. And it only takes more diesel.

René Herbert Reich 5:29

Mmh.
Uwe.

Fabianová Ivana 5:44
if it needs for the Lord to move.

René Herbert Reich 5:47
Mhm.

Fabianová Ivana 5:48
And so this is one of the levers, for example, for reduction of the emissions we could do, we could implement more and more.
But this will not be enough to reduce the emissions to be 1.5 degree aligned. So we know like whatever we have in control, without the transition to electric vehicles, we can't really make it.
So we are debating now what our targets should be. Should we set lower targets of the 1.5 degree? Should we still go for 1.5 degree and hope? What should we do? So it's a bit of a debate in the company of what we are doing. And then we would like to 1st set this target and then

René Herbert Reich 6:26
Mhm.

Fabianová Ivana 6:32
Translate.
doves into the product development process. So if we now, for example, say, okay, we are not going for 1.5 degree, we are not comfortable to committing because we don't think much will change. It's really just behind the corner. The 2030.

René Herbert Reich 6:37
Yeah.

Fabianová Ivana 6:55
Should we set lower target, should we say 10%? We can reduce 10% and we will go for the technologies that we can influence like the load sensing so we can implement

the load sensing technologies. Some markets adopt to it better than the others. Some markets are a bit resistant to it.
So that's, for example, one of the things we could we could change. Another thing is a map of technology is basically the track would stay as it is, so it would be a diesel truck, but our crane on it would run on electricity. So it's kind of a hybrid solution.

René Herbert Reich 7:18
Yeah.
Mhm.

FI Fabianová Ivana 7:34
So there is something again we can...
We can influence, it's a bit difficult sometimes to persuade the customer to do that. Also, if we have the battery on the track, it increases the weight of the track, for example. So there's always a trade-off. So we first would like to set our targets, our emission targets, what we want to achieve as a company, and then we will translate it into

René Herbert Reich 7:50
Yeah.

FI Fabianová Ivana 8:02
product development process, which is very, very extensive process. So when we look at it, there are like swim lanes and different things. So it's quite complicated. We try, we did a test with, this was for timber and recycling cranes, especially for a timber cranes. So there we try.

René Herbert Reich 8:07
Yeah.
Uwe.

FI Fabianová Ivana 8:23
to see what we can put into product development process right now.
So there was kind of a bit of our pilot, but we are not that fired that we would have set some requirements already in the product development process.

René Herbert Reich 8:41

Yeah. But if I understand you correctly, you're trying to implement sustainability, not just in the company, but also in the product development process based on your own ambition. And it's not a requirement that comes from the customer. You're actually counteracting to the customer and trying to convince them.

Fabianová Ivana 8:55

Yeah.

Yeah, so it a bit depends product line per product line. So there are some that there is a push and there are some that there is a pool. So it a bit depends, for example, platform. So we also have these aerial work platforms.

René Herbert Reich 9:05

Mhm.

Mhm.

Fabianová Ivana 9:18

There is a bit more demand from the customer because they are also used a lot in urban areas, so not on a construction site, but rather in the cities. And the cities are going for the 0 emission zone or low emission zone.

and therefore the electric platforms are obviously the right choice. Also, one thing is the emission reduction, another thing is they are really quiet, so they can work at night, which is better, it's better in the traffic, it's better for the town.

René Herbert Reich 9:52

Mhm.

Fabianová Ivana 9:57

if the work is done at night. And they can also operate like close to, for example, hospitals and areas where you should really not be allowed. So that's a big advantage. So there is more demand in platforms than there is, for example, in cranes. There are some bigger customers that ask for that because those have... Their own emission targets, like, for example, so they've been asking for that, but the single customers that buy 1-2 cranes and run their own business right now, they

don't really care to be honest, so there we need to explain, they don't even want to take the load sensing, you know, we need to explain.

René Herbert Reich 10:23
Yeah.
Yeah.

Fabianová Ivana 10:40
what benefit it has to them. Like, okay, maybe it's a bit more expensive, but there is a return on investment because it consumes less diesel, right? So over time, it's kind of, yeah, there is a payback. So it's always a bit like more of explaining the benefits to customers.

René Herbert Reich 10:42
Yeah.

Fabianová Ivana 11:01
And then there are some other customers we also have cranes on the wind turbines offshore.

René Herbert Reich 11:08
Yeah.

Fabianová Ivana 11:10
And obviously, because it's a wind turbine, the crane is fully electric on it. So by nature, these customers wouldn't want any diesel run crane. So this needs to be all electric. So there is a bit and also the track mounted forklift.

René Herbert Reich 11:22
Yeah.
Yeah.

Fabianová Ivana 11:31
There is a bit more demand, but...

The crane is the biggest product line is 55% of all products sold is the crane, the track mounted crane. So we need to move that one and it's a bit difficult.

René Herbert Reich 11:41

Yeah, yeah.

But it's very interesting because normally, so from others interviews, what we heard so far, normally they're very, as you said, it's very, very much of A pull from the customers of saying, okay, the customers approach them that they, the machine has to be more sustainable, that it has to be more repairable.

Fabianová Ivana 11:55

Yeah.

Ruiz.

Mm.

René Herbert Reich 12:10

And you're the first one who's saying, "No, no, we define our own targets, and then we try to break it down to to the to the product level, and I can, so it's for me a little bit interesting. How does this work? So, first you have on strategic level the company targets, but how do you then break down company targets to...

Fabianová Ivana 12:14

Yeah.

Yeah.

Mhm.

René Herbert Reich 12:30

On the product level, because there's still some gap in there.

Fabianová Ivana 12:34

Yeah, so it's quite a process. That's why it also takes as long first to define the targets because we need to go product line by product line. There are several, 10 or so, I don't exactly know anymore. And we need to talk, and everyone is so different. Each of these product lines is basically really different product.

René Herbert Reich 12:45

Mhm.

MM.

Fabianová Ivana 12:57

As you say, it's like so far off, so we need to know.

Do we have the technology to do that? Are we ready to implement it? Is the customer, are the customers going to accept it? Some things are easier to put in the product development process than the others. Like for example, okay, we want to use low emission steel.

René Herbert Reich 13:10

Mm.

Fabianová Ivana 13:22

Customers don't really, it's the same still in the end, they don't even need to know, or they don't wouldn't know. If they want to know, it's good, like if they care about it, but it's not like you're changing something, like because with the load setting, for example, you're changing something, they can clearly hear it.

René Herbert Reich 13:27

Yeah.

Mhm.

Fabianová Ivana 13:38

But if you say, okay, we are just buying a low emission steel, so the steel that is produced in the electric arc furnace, so run by electricity, not with the coal.

That's something it doesn't change the quality of the steel, so they don't really care about it. You don't, yeah.

René Herbert Reich 13:57

But do you, that's a super interesting point, but is that like a meeting of discussion or do you have hard calculations? How do you make this decision of what to do and what not to do?

Fabianová Ivana 14:01

Yeah.

Mm.

Yeah, we have hard calculations of every product line. We do our own calculation. We say with the engineers, this is what we think it's possible. Like technically it's possible. We're not saying about the market. Technically this will be possible. We then go to the product line lead. So every product line has their own lead. So that's

René Herbert Reich 14:13

Mm-hmm.

Mhm.

Hello?

Mm.

Fabianová Ivana 14:29

the head of each product line. We discussed that, they give us their points and what is good for me, I told you we have this like, so I have the climate and my colleague has a circular, another colleague has different topics. Each topic has a sponsor and the sponsor is a board member minus one.

René Herbert Reich 14:46

Mhm.

Mm-hmm.

Fabianová Ivana 14:51

So a very senior person. And the sponsor for Climate is the vice president of all product lines. So he's the head of all product lines, then report to him. And he's my sponsor for Climate. So in that way, it helps that he's really

René Herbert Reich 14:59

Mhm.

Fabianová Ivana 15:11

Into the topic, you know, like, and so that helps a lot, but of course you need to. managed to still sell the products. So there is a long, long process.

René Herbert Reich 15:21
Yeah, yeah, yeah.

Fabianová Ivana 15:26
of trying with the guys, really with the product lines, with the engineer, to discuss what is possible, how can we do this? And then we all the way go to the vice president. And then we have a sustainability council. So there are all these sponsors. And there is one board member. And then there is the sustainability team and some other senior executives. And then they ultimately take a decision on what we do. So they ultimately report to the board.

René Herbert Reich 15:57
Mhm.
Okay, so really the change, the change in the product itself is decided by the board.

Fabianová Ivana 16:02
So, it's a very, very long process, and then they disagree on something.
Like, if this is all sustainability, I'm saying, so ultimately it will go all the way, yeah.

René Herbert Reich 16:13
Yeah, yeah, yeah.
Really? Oh, really?

Fabianová Ivana 16:18
And they will say, okay, they think this is something we should do, this is something we should not do. Maybe we should postpone it. Or they send us back with some other requirements to calculate this and that, and then we go all the way, all the way back again.

René Herbert Reich 16:23
Mm.
Mhm.

And what normally, what do you present? You don't have to go into details here, just overall, like what are they interested in, like carbon footprint, carbon emission reduced, or costs, or what other indicators do you want? What other data do they ask to make a decision?

FI Fabianová Ivana 16:38

Yeah.

Yeah.

Yeah, so normally we show them kind of a waterfall. So where we are, what are the sales, projected sales for 2030 or 2040. And then we show, okay, these measures are already in the pipeline. So these measures is already in a plan. Where would that lead us? So what the emissions would be after implementing all this.

And what additional measures do we need to take to meet the target X? So that's, for example, what we show. We are showing a lot of the load sensing. I thought to you about what is the adoption in different countries? How can we discuss with the sales teams, with the sales reps?

How can they maybe promote it better? Are they promoting it? Are they talking about it with the customers? Are customers understanding the benefits? Now from this year, we are going to be selling this map, so that's this hybrid, a hybrid unit. Again,

Do customers understand it? Do they know how to operate it? Do they know?

So more also with the sales teams as they were not really involved in the beginning.

René Herbert Reich 18:02

Mhm.

FI Fabianová Ivana 18:06

So, they can talk to the customer, they can they can explain the new features.

We sometimes have the feedback from the customer, so that's sometimes where we get stopped at our products are over-engineered, like they have.

René Herbert Reich 18:21

Mhm.

FI Fabianová Ivana 18:23

like unnecessary function or the functions, they don't really know what to do with them. They get too complicated sometimes, so that's something that we need to take it back.
Yeah.

René Herbert Reich 18:35
Okay, interesting. And is this a smooth process that you normally, before you prepare a board meeting, talking with sales, doing this analysis? I guess all this market projections analysis is all done by Excel? Or you have a different solution for that?

Fabianová Ivana 18:42
Yeah.
That's done in the.

René Herbert Reich 18:54
Ohh.

Fabianová Ivana 18:54
So the sales of the projection of sales, it goes, I get the numbers from controlling. But this is not something I would need to calculate. I ask controlling to give me the numbers. They calculated with every product line. They calculate the projected sales, how they calculate their honestly.

René Herbert Reich 19:00
Mm.
Mhm.

Fabianová Ivana 19:13
Don't know.

René Herbert Reich 19:14
Yeah, but it's all Excel-based now, all the communication and everything. How do you receive it?

Fabianová Ivana 19:15

They got good.
I, I received it in a simple Excel.

René Herbert Reich 19:23
Yeah, exactly.

Fabianová Ivana 19:24
I, yeah, so, yeah.

René Herbert Reich 19:27
Yeah, yeah, yeah, and then all the other calculations, probably also your carbon emissions, it's simple carbon accounting.

Fabianová Ivana 19:36
Yes, we do have a software we are using, so we are starting to use it. We don't use it yet for the official calculation.
Phone.
As you know, the data that goes in needs to be first good. So the outcome from the software is also good. So right now, the official calculation that you would see the result of within the annual report is still done in Excel indeed by ourselves. But we are using this software, it's called CarpMe.

René Herbert Reich 19:52
Mm.
Yeah.
Mm-hmm.
Mm-hmm, correct me. No.
Yep.

Fabianová Ivana 20:27
Yes, we need to 1st improve, improve our own on data entries, yeah.

René Herbert Reich 20:32
I'm very surprised because you said, okay, in the board meeting, you're presenting market projections where you are like a waterfall. However, where is, for example, the

sustainability aspect in that, right? Where do they see which kind of decisions they're making? Or is it really just sales, sales numbers?

Fabianová Ivana 20:49

What?

No, no, this is the numbers of, these are the emission numbers. So the waterfall is with the emission. So we say, okay, this, maybe there's some efficiency improvement, this result of a reduction of X amount of emissions. So this is the waterfall with the emissions. So with different

René Herbert Reich 20:56

Ah, initially, OK, OK, yeah.

Yeah.

Fabianová Ivana 21:12

measures we can take and then the measures we can't really like the BEF transition, what we think it's going to be. So what are our OEMs or the track manufacturers, what are their targets? Do we think with our research that we did, are they going to make this target?

René Herbert Reich 21:18

Mhm.

Fabianová Ivana 21:31

So we account for some reduction from the electric vehicles and then the measures then we can take. So these are the waterfalls are emission waterfalls and not the sales. I just need to take the sales because if I'm calculating for 2030 or 40 or then I need the sales numbers.

René Herbert Reich 21:40

Yeah, yeah.

Hi, Himanshu, and...

The real, the real numbers, not the revenue, but the items, items sold, yeah, yeah, the units, that's what, and and and then they contrasted it to the costs, or what what what are they based on, just just on carbon potential?

Fabianová Ivana 21:55

The exactly the units, yeah.

Yeah, yeah, yeah, yeah.

This is just on carbon, but the cost is another discussion, right? So for example, the load sensing technology, again, getting back to that.

Right now, it's a bit like if you want a crane with a load sending technology is more expensive than the constant one.

René Herbert Reich 22:23

Mhm.

The.

Fabianová Ivana 22:26

And the discussion is, are we, what if we just do a default, a load sensing by default? Then we set the different markets. So will our competitors follow? So there's another, or will they use the constant pump still and will our customers shift to them? Will we lose the customers therefore? Or will we set the new standards in the market and will our competitors follow as they have their own emission targets as well?

René Herbert Reich 22:45

Mhm.

Yeah.

Mhm.

Fabianová Ivana 22:56

So this is a bit of a discussion.

René Herbert Reich 22:59

And that's just a discussion or are there also calculations involved in that because you could also calculate do customers follow, won't they follow, or is it just purely qualitative back and forth?

Fabianová Ivana 23:07

Yeah.

Exactly, yeah. So what we were now calculating was what it was cost us. So if we just do low sensing by default, what are the costs, if we bear the cost of it. So if we don't make the product more expensive, we just do it as a default and the customer, they don't need to pay anything extra. What cost it would be for us as a company? Would it be a cost?

René Herbert Reich 23:21
Uwe.

FI Fabianová Ivana 23:31
That was my, is it even like more expensive to produce it or is it just, are we selling it as a premium? So this kind of debates we have, like if we take some of these costs to promote it with our customers, then yeah, what it would be.

René Herbert Reich 23:31
Mmh.
Yeah, yeah, yeah.
Yeah, and it's super interesting. The question is then, when you when you decide, let's go for the load sensing, as it's obviously a popular example, that's that's then then.

FI Fabianová Ivana 23:54
Mhm.
Yeah, yeah, it is.

René Herbert Reich 24:02
Then when they decide to go for it, that's when the actual product development starts, no? Because then you really have to implement where to put the sensor. Then really the engineers have to dig into the product or...

FI Fabianová Ivana 24:04
Mhm.
So the load selling technology is already developed. We're selling cranes with that. So it's not that we need to develop it. It's more like the customer, they just need to order it. And it's not a problem. It's not a big deal to do that.

René Herbert Reich 24:16

Yeah, yeah, yeah, yeah.

Yeah.

But back then, back then, when you when you took the decision, that's when you really have to develop it. It's not that you first could develop it and then present it to the to the group, right? Yeah, yeah.

Fabianová Ivana 24:29

Mhm.

Yes.

Yeah, yeah, yeah, yeah, that's correct, yeah.

René Herbert Reich 24:38

So the actual feasibility, you'd first ask the engineers, is it actually possible? And they would more or less say roughly.

Sure, why not? Okay, okay, okay.

Fabianová Ivana 24:48

Exactly, yeah, yeah, exactly. So they would go to the...

Excel things and close themselves in, and you know, do their do their metric, and then they would come back, say this is possible, this is the reduction of fuel, their operating hour, and they would do their calculation, and then we would calculate their emissions together. So that was going back, yeah, into the product development process, yeah.

René Herbert Reich 24:56

Yeah.

Okay.

Yeah, and then and then after the decision, they're really going back and like, okay, now we really have to change it and see how we can manufacture it. Yeah.

Fabianová Ivana 25:18

Yeah.

Yeah, yeah. Or for example, another topic like making the products lighter, right?

René Herbert Reich 25:23

Yep.

Yeah.

Fabianová Ivana 25:27

This is also very difficult, because, by kind of by...

It's a bit of a legacy, right? So the company is always proud. The product are strong, you know, they can lift heavy things, but could they lift heavy things if they will be lighter? Still, like where is the where is the border, you know, so they could still lift what they're supposed to live and still would be safe.

René Herbert Reich 25:48

Thank you.

Fabianová Ivana 25:52

but could we reduce the weight of it to reduce the emission? So this is, but there is this this proudness of how robust the products are, for example, right? So there's always a need to, yeah.

René Herbert Reich 25:53

Mm.

Yeah, yeah, yeah.

Yeah.

Fabianová Ivana 26:06

And these are very sensitive things, like in cranes, it is so difficult, like some product lines are much more easier, but the the the the cranes.

René Herbert Reich 26:21

Okay.

Mmh.

Yeah, yeah, yeah.

Fabianová Ivana 26:39

It's like there are some like the electric cranes. The operators love it because they love that it's quiet. They don't care so much about the emissions, but they care that they work with it all day somewhere in construction.

René Herbert Reich 26:47
Mhm, mhm.
Yeah.

Fabianová Ivana 26:54
And it's just quiet and they don't need to shout at each other to hear. It's just a complete different comfort with it. So that's what we try also to promote more, that it's low noise rather than no emission.

René Herbert Reich 26:56
Yeah.
The.
Yeah.
Yeah, yeah, yeah. That's very interesting. It's super interesting.

Fabianová Ivana 27:12
Yeah, yeah, yeah.

René Herbert Reich 27:15
Yeah. So is there something in that process you just described where you say, okay, this is the biggest pain point that's if I now make you a magician and you have a magic wand, what would be what would be the first thing that you would change in all this process of trying to be more sustainable products?

Fabianová Ivana 27:26
Mhm. Oh.
Oh wow, it will be so many things.

René Herbert Reich 27:39
It's really a pain point where you're like, oh my god, that's the worst part of my job.

Fabianová Ivana 27:40

Jessica.

For me, for me, it's like when we spend so much time on calculating all those things, and then the board send us back to recalculate, and it takes us such a long time, and I don't know if they are realising how much time it takes from those engineers to do that.

René Herbert Reich 27:55

Mhm.

Fabianová Ivana 28:04

I also wish the company sometimes would be braver and taking the risk and using the position as the leader in the market of this product because we are a market leader. So using that position a bit more, I was working in the Netherlands before, before I came to

René Herbert Reich 28:17

Mm.

Mhm.

Fabianová Ivana 28:26

to Austria and I had a feeling there like we were just trying stuff and it didn't work. So we didn't, you know, but we gave it a try.

René Herbert Reich 28:35

Yeah.

Fabianová Ivana 28:35

So there was a bit more risk taking than it is. I don't know if it's the Austria thing or if it's the Bauer thing.

René Herbert Reich 28:41

Yeah, yeah, no, I have the same feeling from Belgium, yeah, moving back from, yeah, yeah, yeah, it does the same.

Fabianová Ivana 28:44

Yeah, yeah, right. So there was more, yeah, more bravery to just to just try Tingting and maybe to fail and it was OK. So that's something I would wish that that.
People are a bit more open to those things. It's maybe not an easy answer for you, but that will be them.

René Herbert Reich 29:00

Mhm.
So, if somebody, if, if, if you would have a tool where you could do these calculations in one click, you would, you would love, you would love to pay for it.

Fabianová Ivana 29:13

Oh, that would be awesome.
Yeah, that would be awesome if we could do that.

René Herbert Reich 29:18

Yeah, yeah, yeah, yeah.

Fabianová Ivana 29:20

Obviously, yeah, just as simple as just even calculating the carbon emission or carbon footprint takes us a lot of time right now.

René Herbert Reich 29:30

Yeah, on product level, you mean? Yeah.

Fabianová Ivana 29:33

On product level, on the company level as well. So I'm calculating the product level as well, but on the company level too.

René Herbert Reich 29:37

Mhm.

Fabianová Ivana 29:44

Yeah.

René Herbert Reich 29:47

Okay, good. Any, do you have any questions before I'm?

Fabianová Ivana 29:53

How are you going to use the information?

René Herbert Reich 29:56

Yeah, so we are trying to conduct something like around 50 interviews like this one. We are already quite good. I think we were at 37, 38. Yeah, so we're really trying to get different. So we were very busy in the automotive sector.

Fabianová Ivana 30:01

Mhm, mhm.

Okay, interesting.

Yeah.

René Herbert Reich 30:15

And I'm very happy. I'm very happy that we've finally found somebody outside of automotive doing something different. I really like it. And we're using that and we're really trying to get the feeling what are the pain points, what is the added value that we can offer and with our future product, with our future software.

Fabianová Ivana 30:15

Yeah.

Yeah, yeah, yeah, yeah.

Yeah.

Yeah.

Yeah.

René Herbert Reich 30:34

And we heard, we heard a lot actually, those calculations, those analysis, is very painful and you have probably, I don't know how many times you have to iterate and redo them. If you would say, okay, how many hours do you normally spend on one calculation redoing it?

Fabianová Ivana 30:39

Mm.

Yep.

Well, I luckily like these, the measures I don't need to calculate myself so that the engineers are doing that. I will purely calculating the carbon footprint, the company carbon footprint I calculate still manually myself. There is all these measures that I told you for some targets on the product level is done by the engineer so they know.

René Herbert Reich 30:58

Okay.

Mm.

Mm.

Mmh.

Fabianová Ivana 31:17

these measures, they know what reduction it will bring. I will then just translate it into a mission. So that's there. But it's taking them so much time and I know how much other priorities they are having. And that is then like, okay, I know how much time they spend on it. And then something

René Herbert Reich 31:20

Yeah.

No.

Fabianová Ivana 31:37

somebody at the board level, at the council level asked and then like we gave them now, like calculated the 2030. They came back asking for 2040. So could we do the same with the 2040? And oh my God, now we need to go back to them and ask them, hey guys,

René Herbert Reich 31:45

No.

Yeah.

Yeah.

Fabianová Ivana 31:57

Let's look at 2040 when we don't even have official like sales projections yet.

René Herbert Reich 31:59

Yeah.

Yeah.

Fabianová Ivana 32:05

And this, they would say, you know, Ivana, I have so many other things on my plate, unless it's coming from the product line lead, I can really dedicate more time on that right now. And that's always a bit of a trade-off and I hate to do that, I hate to then, you know, escalate it and...

René Herbert Reich 32:10

Yeah.

Yeah.

Yeah, yeah.

Fabianová Ivana 32:26

and ask for their time. So that would definitely help if it's an easier, easier. And the thing is also such a, we have such a diverse portfolio, which is good for us.

René Herbert Reich 32:28

Yeah.

Mhm.

Fabianová Ivana 32:42

given the risk, the market, et cetera, makes us resilient. But there are so many different products within the product line. There are different product groups. So I would also wish it's just a catalogue with 10 products per product line. But there are so many different products within product lines that makes it also very, very complicated.

René Herbert Reich 32:55

Mm.
Yeah.
Yeah, yeah, I can imagine.

FI Fabianová Ivana 33:04
Yeah.

René Herbert Reich 33:05
Yeah, no, definitely, and if you so my actually my last question is always, do you could you recommend any colleague where we should talk to and you say, René, that's that's your target?

FI Fabianová Ivana 33:10
Mhm.
I will.
Does your guy?

René Herbert Reich 33:20
That's your guy.

FI Fabianová Ivana 33:20
I will.
I can, first of all, I could connect you with David. So he's the, I told you my right hand in the product line. So from our organization, he's the programme manager of product sustainability, as it's called officially. I just looked. So he is sitting in the product line and he is my right hand.

René Herbert Reich 33:31
Mm-hmm.
Beautiful, yeah.
Yeah.

FI Fabianová Ivana 33:45
I don't normally talk to the engineer myself. I ask him, that really helps. And he sits there in the PLM&E.

René Herbert Reich 33:48
Yeah, yeah, perfect.
Yeah.

Fabianová Ivana 33:55
which is helping because he's seen as one of them, you know. We are sometimes seen as the strategy people, you know, sitting at the headquarter like, you know, what do they know?

René Herbert Reich 34:03
Yeah.

Fabianová Ivana 34:07
The Dreamers, but he is really one of them, right? He's 6, they are in Kostendorf.

René Herbert Reich 34:08
Got.
Yeah.

Fabianová Ivana 34:13
Yeah, they sits with them as such, so it's really a different, yeah, it's really helped, and he he just it's a new position. He's with Paudel for a longer time, but he just he did his the buildings current on sustainability, and now he's our right hand there, so I would connect you with him.

René Herbert Reich 34:29
Yep, yep, yep.
Yes, that would be great.

Fabianová Ivana 34:35
And I can cheque with other contacts within other companies like DOCA. I don't know if you heard, if you talk to DOCA already. No, okay. So for example, with them, we have a good, we always bounce together, sustainability team, there's sustainability team in our.

René Herbert Reich 34:43
Yeah, no, no, no, we did not, but...
Nice.

Fabianová Ivana 34:56
So I could maybe get you in contact there.

René Herbert Reich 35:00
Do you do you do you need something from me? Should I send you like an e-mail template that you can forward or can I?

Fabianová Ivana 35:06
Please, that would be great, yeah.

René Herbert Reich 35:08
Perfect. Thank you very much. Yeah, that's definitely.

Fabianová Ivana 35:09
That would be great, yeah, and I may give it some, give it some thoughts and, and yeah, see if I can connect you with anyone.

René Herbert Reich 35:17
That would be great, because, yeah, as you see, I hope you had some some good time. You also got some...

Fabianová Ivana 35:19
Yeah.
Yeah, yeah, yeah, absolutely, yeah, yeah.
Thank you so much.

René Herbert Reich 35:30
No, thank you so much for your time. It was...

Fabianová Ivana 35:32

Yeah, if you send me, I'll do that, okay? Okay.

René Herbert Reich 35:35

Yeah, yeah, perfect. You will get it this afternoon. Yeah. Thank you very much for your time.

Fabianová Ivana 35:38

Okay.

Yeah, if there is anything I can have, let me know.

René Herbert Reich 35:43

Yes, definitely.

Thank you. Bye.
